[Chronostratigraphy](#)

**Author:** after Geukens, 1999.

**Description:** Thick beds of light coloured to light greenish quartzite and green slate. The white sandstone is locally altered into a reddened sandstone.

**Stratotype:** outcrop in the Rocher de Hourt along the road N28 between Trois-Ponts and Vielsalm.

**Area:** In two anticlinal structures (Grand-Halleux and Ligneuville) in the southern part of the Stavelot Massif.

**Thickness:** >150 m.

**Age:** Due to the absence of macrofossils and acritarchs in the formation, a possible Neoproterozoic to Early Cambrian age is tentatively proposed (Mortelmans, 1977; Vanguestaine, 1992).
