[Chronostratigraphy](#)

Author: Beugnies, 1960.

Description: Black coarse-grained slate and silty slate (called "quartzophyllade" in the older literature), very rich in ilmenite and chloritoid crystals (small to 4 mm in size); the base of the unit is not observed (Beugnies, 1960).

Stratotype: not yet defined; type area in the outcrops along the N89 (Saint-Hubert -Recogne).

Area: Serpont Massif.

Thickness: at least 250 m (Beugnies, 1960).

Age: No palaeontological data collected; Geukens and Richter (1962) place this formation partly as an equivalent of the Salm Group.

(M. VANGUESTAINE)
